- Surveys optimal
- Surveys sub-optimal
- Surveys cannot be undertaken / results unreliable

¹ Internal building searches for evidence of bats can be undertaken at any time; winter is the best time for assessing trees for roosting potential, with further work to confirm potential undertaken in spring / summer.

² The timing of detailed flora surveys is dependent on the specific habitat type to be investigated. Lower plants should be surveyed in winter.

³ Timing is dependent on target species/group.

⁴ Surveys are required in both the early and late seasons.
